Listing of Claims

This listing of claims will replace all prior versions in the application:

1. (previously presented) A method for data cleansing, comprising:
   receiving at least one input address;
   comparing said at least one input address to at least one standard; and
   providing a single best address derived from said at least one input address based on said comparison.

2. (original) The method according to claim 1, further comprising:
   matching said single best address to a database having unique business identifiers associated with addresses to find a matching address; and
   providing said matching address.

3. (original) The method according to claim 2, wherein said database is an advanced office system (AOS).

4. (original) The method according to claim 2, further comprising:
   providing a match project analysis report.

5. (original) The method according to claim 1, further comprising:
   converting said at least one input address to a predetermined record layout, before comparing said input address to said at least one standard.

6. (original) The method according to claim 1, further comprising:
   associating said at least one input address with at least one code, said code being used to determine said single best address.

7. (original) The method according to claim 1, further comprising:
   associating said at least one input address with at least one score, said score being

used to determine said single best address.

8. (original) The method according to claim 1, wherein said at least one standard is at least one selected from the group consisting of: ZIP+4 coding, coding accuracy support system (CASS), Locatable Address Conversion System (LACS), delivery sequence file (DSF), and National Change of Address (NCOA)

9. (original) The method according to claim 1, further comprising:
providing a report.

10. (original) The method according to claim 9, wherein said report is selected from the group consisting of: a postal summary report and a pre-audit report.

11. (original) The method according to claim 1, further comprising:
sending at least one status notification to a user who supplied said at least one input address.

12. (previously presented) A system for data cleansing, comprising:
    a pre-auditor for generating a report having a plurality of views of an input
        address file, said input address file including a plurality of addresses;
    a verifier for finding and removing any invalid records from said input address
        file;
    a vendor interface for sending said input address file and an order to at least
        one vendor and for receiving an output file from said at least one vendor;
        and
    a user interface for providing a single best address derived from each
        address in said input address file.

13. (original) The system according to claim 12, further comprising:
a matcher for attempting to match any address in said output file or said invalid records to a matching address in a database having unique business identifiers

associated with addresses.

14. (original) The system according to claim 13, further comprising:
an investigator for investigating any address not matched, upon request.

15. (original) The system according to claim 12, wherein said pre-auditor calculates a plurality of counts associated with said input address file.

16. (original) The system according to claim 12, wherein said input address file includes a plurality of records and each record includes a plurality of fields.

17. (original) The system according to claim 16, wherein said count is at least one selected from the group consisting of: a number of distinct values by field, a missing field count, a total number of records, and a percent of distinct values.

18. (original) The system according to claim 12, wherein said view is at least one selected from the group consisting of: alphabetical, most frequent content, and alpha characters only.

19. (original) The system according to claim 12, wherein said vendor standardizes addresses using at least one process selected from the group consisting of: Locatable Address Conversion System (LACS), delivery sequence file (DSF), and National Change of Address (NCOA).

20. (previously presented) A machine readable medium having instructions stored thereon to perform a method for data cleansing, comprising:
        receiving at least one input address;
        comparing said at least one input address to at least one standard; and

providing a single best address derived from said at least one input address
based on said comparison.

21. (original) The machine readable medium according to claim 20, further
comprising:

matching said single best address to a database having unique business
identifiers associated with addresses to find a matching address; and
providing said matching address.
